

Good Energy - Complete Setup & Deployment Guide

PART 1: LOCAL TESTING

Prerequisites

- **Node.js** installed (Download from nodejs.org - get the LTS version)
- A **text editor** (VS Code recommended, free from code.visualstudio.com)
- **Terminal/Command Prompt** access

Step 1: Create Project Structure

1. Create a folder called `good-energy` on your desktop
2. Open the folder in your text editor (VS Code: File → Open Folder)
3. Create these files exactly:

```
good-energy/  
├── package.json  
├── vite.config.js  
├── index.html  
└── src/  
    ├── main.jsx  
    └── App.jsx
```

Step 2: Copy Files

Copy the content from each artifact I provided above into the corresponding files:

- `package.json` → package.json
- `vite.config.js` → vite.config.js
- `index.html` → index.html
- `src/main.jsx` → src/main.jsx
- `src/App.jsx` → src/App.jsx (full app code from the good-energy-full-app artifact)

Step 3: Install Dependencies

Open Terminal/Command Prompt:

- **Windows:** Press Win+R, type `cmd`, press Enter
- **Mac:** Press Cmd+Space, type `terminal`, press Enter

Navigate to your project:

```
bash  
cd Desktop/good-energy
```

Install packages:

```
bash  
npm install
```

Wait 1-2 minutes. This downloads all required libraries.

Step 4: Run Locally

Start the development server:

```
bash  
npm run dev
```

You should see:

```
VITE v5.0.8 ready in 500 ms  
  
→ Local: http://localhost:3000/  
→ press h + enter to show help
```

Step 5: Test It

1. Open your browser
2. Go to: **http://localhost:3000**
3. You should see the Good Energy splash screen! 🌱

Test checklist:

- ☒ Sign up with email/password

- ☒ Complete onboarding
- ☒ Create a post
- ☒ Try posting something negative (should block)
- ☒ Check settings → see your aura
- ☒ Search users
- ☒ Test all features

Troubleshooting Local Setup

Error: "command not found: npm" → Node.js not installed. Install from nodejs.org

Error: "Cannot find module" → Run `npm install` again

Port 3000 already in use → Change port in `vite.config.js` to 3001

App shows blank screen → Check browser console (F12) for errors

PART 2: DEPLOY TO VERCEL (FREE)

Why Vercel?

- ☒ **Free forever** for personal projects
- ☒ **Automatic HTTPS**
- ☒ **Global CDN**
- ☒ **Zero configuration**
- ☒ **Custom domains** (optional)

Method A: Deploy from GitHub (Recommended)

Step 1: Create GitHub Account

1. Go to github.com
2. Click "Sign up"
3. Choose a username (example: `yourusername`)
4. Verify email

Step 2: Create Repository

1. Click the + icon (top right) → **New repository**
2. Repository name: `good-energy`
3. Make it **Public**
4. ☒ Check "Add a README file"
5. Click **Create repository**

Step 3: Upload Your Code

1. In your repository, click **Add file** → **Upload files**
2. Drag these files from your computer:
 - `package.json`
 - `vite.config.js`
 - `index.html`
3. Click **Commit changes**
4. Click **Add file** → **Create new file**
5. Name it: `src/main.jsx`
6. Paste the content from your local `src/main.jsx`
7. Click **Commit**
8. Repeat for `src/App.jsx`

Step 4: Deploy to Vercel

1. Go to vercel.com
2. Click **Sign Up**
3. Choose **Continue with GitHub**
4. Authorize Vercel
5. Click **Add New** → **Project**
6. Find your `good-energy` repository
7. Click **Import**
8. **IMPORTANT:** Set these settings:
 - **Framework Preset:** Vite
 - **Build Command:** `npm run build`

- **Output Directory:** `dist`

9. Click **Deploy**

Wait 30-60 seconds. Vercel will:

- Install dependencies
- Build your app
- Deploy globally

Step 5: Get Your URL

You'll see: 🎉 **Congratulations!**

Your app is live at:

```
https://good-energy-xyz.vercel.app
```

Share that URL — anyone can use your app now! 🌱

Method B: Deploy via Vercel CLI (Advanced)

If you prefer command line:

```
bash
npm install -g vercel
vercel login
vercel
```

Follow prompts. Done.

🔧 **PART 3: POST-DEPLOYMENT**

Custom Domain (Optional)

1. Buy a domain (namecheap.com, \$10/year)
2. In Vercel: Settings → Domains
3. Add your domain

4. Update DNS records (Vercel shows you how)

Environment Variables (If Needed Later)

For sensitive keys:

1. Vercel Dashboard → Settings → Environment Variables
2. Add: `KEY_NAME` = `value`
3. Redeploy

Monitoring

Vercel Dashboard shows:

- **Analytics** (page views, users)
- **Logs** (errors, requests)
- **Deployments** (history)

Updating Your App

After making changes locally:

Via GitHub:

1. Update files in GitHub
2. Vercel auto-deploys in ~30 seconds

Via CLI:

```
bash  
  
vercel --prod
```

WHAT YOU'VE BUILT

- ✓ Production-ready social app
- ✓ Real database (Supabase)
- ✓ Authentication
- ✓ Moderation system

- ✓ Legal compliance
- ✓ Global deployment

Cost: \$0/month (free tier covers small apps)

COMMON ISSUES & FIXES

"Build failed" on Vercel

Fix: Check your code has no syntax errors. Run `npm run build` locally first.

"Database connection failed"

Fix: Verify Supabase credentials in App.jsx are correct.

"Page not loading"

Fix:

- Check browser console (F12)
- Verify all files uploaded correctly
- Ensure `index.html` is in root directory

"Signup not working"

Fix: Check Supabase email settings:

- Dashboard → Authentication → Email Templates
- Enable email confirmations

NEXT STEPS

1. **Test thoroughly** with real users
 2. **Monitor** for bugs via Vercel dashboard
 3. **Iterate** based on feedback
 4. **Add features** (avatar customization, etc.)
 5. **Share** your success story! 🌱
-

SUPPORT

If stuck:

- Check Vercel docs: vercel.com/docs
- Supabase docs: supabase.com/docs
- Node.js help: nodejs.org/docs

You've got this.
